# Python Arithmetic Operators – Important Notes

**Definition:** Arithmetic operators are used to perform mathematical calculations.

| Operator | Meaning | Example | Result |
|---|---|---|---|
| + | Addition | 10 + 5 | 15 |
| - | Subtraction | 10 - 5 | 5 |
| * | Multiplication | 10 * 5 | 50 |
| / | Division | 10 / 5 | 2.0 |
| // | Floor division | 10 // 3 | 3 |
| % | Modulus / remainder | 10 % 3 | 1 |
| ** | Power / exponent | 2 ** 3 | 8 |

## 6 Important Examples

**Example 1: Addition**

```
a = 10
b = 5
print(a + b)
```

**Output:** 15

**Example 2: Subtraction**

```
a = 10
b = 5
print(a - b)
```

**Output:** 5

**Example 3: Multiplication**

```
a = 10
b = 5
print(a * b)
```

**Output:** 50

**Example 4: Division**

```
a = 10
b = 5
print(a / b)
```

**Output:** 2.0

**Example 5: Remainder**

```
a = 17
b = 5
print(a % b)
```

**Output:** 2

**Example 6: Power**

```
a = 2
b = 4
print(a ** b)
```

**Output:** 16
